

The impact of the WWS 2024 on apartment portfolios

The changes and consequences of introducing the WWS 2024
using the example of a fictitious housing portfolio

```
import pandas as pd
real_estate_data = pd.read_csv('market_trends.csv')
X = data[['location', 'sqft', 'age']]
model = LinearRegression().fit(X, y)
```

1. THE INITIAL SITUATION

The Dutch rental housing market is among the most strained in Europe.

With the introduction of the ,**Wet betaalbare huur (Wbh)**’ the new ,**Woningwaarderingstelsel (WWS 2024)**’ evolved from a guideline into binding regulation with significant economic implications.

Regulatory Parameter	WWS 2022 (Legacy)	Wbh + WWS 2024 (New)
Market Segmentation	2 Segments: SOCIAAL (< 141 pts) VRIJ (≥ 141 pts)	3 Segments: SOCIAAL (< 144 pts) MIDDENHUUR (144–186 pts) VRIJ (≥ 187 pts)
Rent Control Enforcement	Limited to Social Sector only	Strictly enforced across Social AND Mid-Market segments
WOZ-Cap (Property Value)	33% capping triggers at 141 points	33% capping shifted to ≥ 187 points (Cliff Effect)
Energy Label Impact	Passive bonus framework (No penalties)	High point spread: Heavy penalties for E, F, G (up to -25 pts)

2. THE PORTFOLIO

The fictitious portfolio consists of 1,500 dwellings (105,000 sqm) and reflects a typical developed Dutch housing stock after World War II.

3. THE SHIFT

The introducing of the Wbh and WWS 2024 means regulatory earnings risk and energy-related return opportunities.

Regulatory Rent Exposure
SOCIAAL (< 144 points)

€ 273,362 p.a.
(392 units)

Regulatory Rent Exposure
MIDDENHUUR (144 - 186 points)

€ 184,715 p.a.
(232 units)

The Shift

WWS Points Impact
(Total Portfolio)

4. THE CONCLUSION

The **important regulatory realities** of the WWS 2024:

Segment **SOCIAAL** (< 144 pts)

„The immediate cash flow shock.”

LAW: Strict, proactive rent reduction mandate for non-compliant units after the July 1, 2025 transition deadline. No grandfathering.

PORTFOLIO IMPACT: Immediate, irreversible revenue drop within active leases. High risk of tenant lawsuits and direct municipal fines.

Segment **MIDDENHUUR** (144 - 186 pts)

„The ticking time bomb.”

LAW: Existing pre-July 2024 leases are grandfathered *only* until tenant turnover (mutatie) occurs or maintenance defects force an inspection.

PORTFOLIO IMPACT: Staggered "revenue freeze." The financial downside – initial rents capped at max. €1,157.95 – materializes progressively with each vacancy.

Segment **VRIJ** (≥ 187 pts)

„The ‘all-or-nothing’ game.”

LAW: Initial rents remain fully deregulated. Higher WWS grid values serve purely as a safety net against measurement errors by the „Huurcommissie“.

PORTFOLIO IMPACT: High volatility at the regulatory cliff. Dropping just 1 point can trigger a retroactive cap. Data precision directly dictates asset value.

The WWS 2024 shifts the economic value within portfolios. For corporations and investors, this means:

Sustainability, revaluation, and segment-based management will be crucial for managing risks and capitalising on opportunities.

LEGAL DISCLAIMER & METHODOLOGICAL NOTES

This analysis and the underlying portfolio simulation model have been developed for educational, methodological, and professional discussion purposes only.

The calculations are based on simulated, fictitious data structures designed to reflect the core technical mechanisms under Dutch laws and regulations. Although all regulatory formulas and the programming logic have been researched and implemented with the utmost care, this document does not constitute formal legal, tax or financial advice.

Real-world portfolio outcomes depend heavily on specific asset-level variables, including local WOZ-valuations, municipal enforcement policies, and individual tenancy agreements. For asset-specific investment strategies or compliance audits, always consult with a certified Dutch housing law expert or legal counsel.
